Grieg Seafood is a focused Norwegian salmon producer undergoing a transformation toward greater efficiency and integration. With industry-leading post-smolt biology, strong cost performance, and stable long-term family ownership, we see upside as the market underestimates the value of its operational turnaround.

INVESTMENT SUMMARY

We recommend a **BUY** on Grieg Seafood, with a one-year target price of NOK 80.84, based on a DCF method and supported by Relative Valuation, which implies and upside of 19% based on the closing price of NOK 67.90 on 31.10.2025. The upside is supported by the company's clear transformation toward operational efficiency and strategic stability, as well as by clear value catalysts: (i) macroeconomic megatrends that underpin long-term global salmon demand, and (ii) boosted harvest volumes as the large-smolt strategy scales up. The investment case rests on three structural drivers: (1) downstream integration designed to capture higher processing margins and strengthen market positioning, (2) post-smolt leadership that enhances biological performance and cost efficiency, and (3) long-term family ownership ensuring governance alignment and disciplined capital allocation. These initiatives enhance profitability and resilience, positioning Grieg for sustained margin improvement and stronger long-term returns.

1. Integration Rebuild Unlocks Margin Expansion

Grieg is transforming its structure from a pure farming operator into an emerging integrated producer. The new 12,000-tonne VAP facility at Oslo Airport marks the first step toward downstream control, enabling Grieg to capture more of the value it creates. Positioned next to Norway's main air-freight hub, the facility will reduce transport time and costs while improving freshness and product differentiation for high-margin export and VAP markets. As operations scale through 2025-26 and VAP share rises toward ~25%, integration is expected to lift margins overall by 8.3 ppt, support an estimated ~7% annual increase in revenue per kilogram, strengthen price realization, and reduce exposure to volatile spot markets. We believe the market undervalues this shift toward higher-margin processing, and a rerating is likely as VAP volumes and improved price realization become visible in reported results.

2. Post-Smolt Excellence Drives Biological and Cost Efficiency

Grieg continues to set the operational benchmark for post-smolt innovation in Norwegian aquaculture. In Q2/2025, the company transferred smolt averaging around 1.3 kg (targeting 1.4 kg in 2027) to sea (Figure 3, Appendix 3, 4), nearly double the 2024 level, demonstrating rapid progress toward full-scale post-smolt production in Rogaland, which was supported by favourable biological conditions and strong technological advancements. Larger smolt shorten the sea phase by roughly 30 %, lowering exposure to disease and sea-lice challenges and improving survival to about 92 %, one of the strongest rates in the industry. The shorter production cycle also reduces feed and treatment requirements, supporting a farming cost of roughly 63 NOK/kg, well below the Norwegian industry average above 70 NOK/kg. As Grieg continues to expand post-smolt capacity through 2026, these biological and cost advantages are expected to reinforce its position as one of Norway's most efficient and resilient salmon producers.

3. Family Ownership Ensures Successful Transformation

The current undervaluation overlooks a key differentiator: Grieg's ownership structure. The majority family stake enables a decisive and successful transformation, benefiting from aligned incentives and long-term strategic focus. Corporate Governance research shows that firms with one large committed shareholder and many dispersed minority shareholders are more effective in driving change - a dynamic that competitors without concentrated ownership can't replicate. Furthermore, it demonstrates that having one large shareholder drives up the share price, since it aligns decision-making with long-term value creation and accelerates execution. As governance alignment continues to enhance execution, we believe the market will adjust accordingly (Figure 4, Appendix 5).

Grieg Seafood ASA is one of Norway's leading salmon farming companies, headquartered in Bergen and listed on the Oslo Stock Exchange (GSF) in 2007. The company produces high-quality Atlantic salmon through a fully integrated value chain encompassing breeding, freshwater and seawater farming, harvesting, and sales. Following the planned divestment of its Finnmark and Canadian operations by year-end 2025, Grieg will operate exclusively in the Rogaland region, leveraging favourable biological conditions and modern infrastructure to support efficient and sustainable production for export to key markets in Europe and Asia. Grieg operates with 19 sea permits and two hatchery permits in Rogaland and, with a workforce of 273 employees in Rogaland and Bergen, oversees an almost fully integrated value chain (Figure 2) - from hatchery and breeding to sales and distribution - enabling control over quality, cost, and biological risk. Grieg targets 30,000 tonnes of harvest volume in 2025, representing <1% of global supply, positioning it as a mid-sized Norwegian producer anchored in the biologically stable Rogaland region.

Operations and Value Chain

Grieg Seafood operates its salmon farming activities in Rogaland, covering broodstock, freshwater and seawater production, harvesting, and sales. The company's land-based recirculating aquaculture systems (RAS) allow for extended smolt rearing before transfer to sea, improving biological control and production stability. Salmon are grown to harvest size of around four to five kilograms at coastal sites and processed locally. Grieg's current product mix is dominated by fresh whole-gutted salmon (~95% of sales revenues), complemented by externally processed fillets and portioned cuts (VAP sales portion of 5%, while targeting 25% in the mid-term) for selected European and Asian markets. With limited in-house secondary processing today - set to change with the opening of the Oslo VAP facility - its offering remains primarily oriented toward commodity formats. While feed production remains outsourced to specialized suppliers, Grieg is gradually expanding its downstream capabilities. The new 12,000-tonne value-added processing facility at Oslo Airport, scheduled to open in late 2025, will add secondary processing capacity and strengthen the company's presence closer to export markets.

Sales Distribution and Geographical Reach

Grieg sells primarily into international markets (Figure 6) via its integrated sales organization, with the bulk of volumes destined for Continental Europe (56.8%), USA (22.8%) and significant customer relationships in Asia (12.0%); select shipments continue to reach North America. The company mainly supplies fresh whole-gutted salmon to retailers, foodservice and wholesale customers, while secondary processing remains limited today. The Oslo Airport VAP plant (late-2025) is intended to increase fillet and portion volumes and enable closer customer programs and direct exports into high-value channels.

Strategic Direction and Positioning

Grieg's strategy following the divestment focuses on building a resilient and efficient single-region platform. Rogaland has historically delivered Grieg's strongest biological and financial performance, consistently outperforming former regions such as Canada and Finnmark in survival rates and EBIT margins (Figure 7), reinforcing the strategic rationale for concentrating all operations in this area, which underlines

The company aims to strengthen its biological performance and cost position through further development of post-smolt capacity, digital monitoring, and operational standardization across sites. The ongoing investment in the Oslo VAP facility marks a step toward deeper market integration and higher value creation per kilo produced, driving an expected lift in margins and supporting the development of a more premium brand.

Divestment from Canada and Finnmark

In 2025, Grieg Seafood completed the sale of its farming operations in Finnmark, Norway, and in Canada to Cermaq. The transaction included all farming licenses, facilities, and related assets in the two regions. Following the divestment, Grieg retained full ownership of its Rogaland operations and sales organization, marking its transition to a single-region producer. The company's activities are now fully concentrated in southwestern Norway, where it continues to develop its integrated farming and processing value chain. The divestment strengthens Grieg's focus on Europe, its core sales market.

Norway's Competitive Edge in a Growing Market

Norway remains the dominant player in global salmon farming, accounting for 54% of worldwide farmed salmon production in 2024 (Figure 9), far ahead of Chile, the UK, and Canada. This consolidated industry structure reinforces Norway's position as the world's leading producer and anchors Grieg within the most competitive and biologically stable region of the sector (Appendix 3, 4, 10). The global aquaculture market continues to expand, valued at USD 310.6bn in 2024 and projected to reach USD 417.8bn by 2030, representing a 5.1% CAGR. Several macroeconomic megatrends-including rising global protein consumption, increasing health awareness, and a growing shift toward sustainable and resource-efficient food systems-are expected to support continued industry growth. Farmed Atlantic salmon, with its favourable biological profile-low land use, low CO_2 intensity, and high nutritional value (rich in protein, omega-3 and vitamin-d) – is well positioned to benefit from these trends, providing a resilient long-term backdrop for Norwegian producers such as Grieg Seafood. **Social and Environmental Forces:** Shifting consumer preferences toward healthier and more sustainable proteins continue to strengthen the positioning of farmed Atlantic salmon. Salmon requires significantly less water and generates a much lower CO_2 footprint per kilo than beef, pork, or poultry, making it one of the most resource-efficient animal proteins (Figures 11, 12). Combined with its strong nutritional profile and traceability standards, salmon aligns well with growing demand for climate-efficient and responsibly produced food across major markets. Furthermore, it is superior in low mortality rates, a critical margin driver that reduces production losses and makes salmon more attractive compared to other protein sources (Figure 8). **Political:** Norwegian salmon farming faces one of the world's toughest regulatory and tax regimes. The 2023 resource rent tax lifted the effective tax rate to about 47%, pressuring returns. High license costs-often above NOK 200mln, create significant barriers to entry and keep the industry concentrated. Local municipalities also play a decisive role in approvals, making growth dependent on environmental compliance.

Structural Demand Growth Supports Long-Term Pricing Power

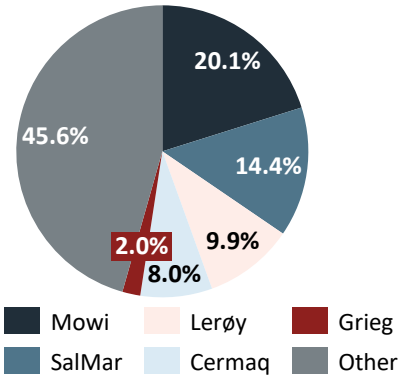

Global demographic growth and rising protein demand: A growing global population-expected to reach around 9.7 billion by 2050-continues to support long-term demand for nutrient-dense proteins (Figure 10). Global salmon consumption is projected to increase by 4-5% annually through 2030, reinforcing the sector's strong structural demand outlook. **European market leadership and stable consumer demand:** Grieg's Norwegian operations are well positioned to capture steady growth in European salmon demand. In 2024, Europe absorbed 52% of Norway's salmon exports, reflecting the region's persistent preference for certified, high-quality seafood. This robust demand environment continues to drive premium prices-illustrated by the NASDAQ Salmon Index averaging NOK 91.9/kg in 2024 (an 8% YoY increase). **Growth in Asian urban markets:** Rising incomes and rapid urbanization in Asia (China, South Korea, and Japan) are fueling demand for Norwegian salmon. Asia accounted for 18% of Norwegian exports in 2024, supported by the region's demand for safe, responsibly produced seafood and Norway's strong ESG credentials. Logistics improvements, such as Grieg's access to VAP capacity at Oslo's airport, further enable market expansion eastward.

VAP Expansion Maximizes Value in a Supply-Constrained Market

Supply constraints and industry margins: While global salmon consumption continues to rise, supply growth is expected to remain limited at 2-3% CAGR through 2030, due primarily to strict regulatory controls in Norway. Farming licenses are costly and strictly capped by the "traffic light" system and maximum allowed biomass restrictions, making expansion challenging for all but the most established players. **Feed prices** remain the largest and most volatile operational cost, typically accounting for 45-50% of total production; variability in marine and alternative feed ingredient supply introduces additional uncertainty-companies with efficient feed conversion rates, such as Grieg, are better able to manage margins. **Biological and climatic risk** is a persistent threat, as disease events (e.g. sea lice and algal blooms) and shifting ocean conditions periodically impact volumes and profitability. In this supply-constrained environment, VAP becomes increasingly important for margin expansion and revenue diversification, enabling producers to capture more value per kg without relying solely on volume growth. Grieg's VAP strategy combined with post-smolt innovation and a biologically stable production base in Rogaland reduces exposure to volatile spot prices, strengthens product differentiation, and monetizes rising demand for premium, sustainably sourced seafood. FAO forecasts global per capita seafood consumption to rise 15-20% from 2020 to 2030, positioning salmon-and Norwegian operators - as key beneficiaries.

- Focused Norwegian operations - Post-smolt control - Strong ESG and governance - Value-added growth	- Long production cycle - Smaller scale limiting bargaining power
O Opportunities	**T Threats**
- Growing demand for sustainable seafood - Downstream expansion - Potential feed integration	- Biological and environmental risk - Single taxation and regulation exposure - Feed inflation, currency volatility and scale pressure

Competitive Positioning

Grieg's competitive positioning is anchored in its **single-region operating model** and its biological performance leadership following the company's post-2025 strategic reset. By concentrating all farming activities in Rogaland - one of Norway's most biologically stable regions - Grieg benefits from tighter operational control, reduced biological volatility, and a simplified cost structure compared to multi-region peers. The company's industry-leading post-smolt strategy further strengthens its position by shortening the sea phase and lowering exposure to environmental and disease-related risks. Moreover, the high technical know-how required, strong site-specific expertise, and capital-intensive nature of salmon aquaculture limit the threat of new entrants. (Figure 14) However, Grieg remains exposed to several **material threats**, the most critical being its elevated biological risk (sea lice, disease, algae blooms), which is amplified by the company's single-region concentration.

Rogaland Focus as a significant competitive advantage

Small Player with Significant Advantages: By managing all sites within a single region, Grieg can develop new technologies far more rapidly and consistently than multi-region peers. This focused platform enables agile deployment of advanced post-smolt practices, automation, and biosecurity improvements, directly supporting superior operational predictability and margin stability. Rogaland offers exceptionally favourable natural conditions for salmon aquaculture, with stable temperatures, strong water exchange, and sheltered fjord systems-making it one of Norway's most productive regions for farming. **Rogaland's moderate water temperatures (6-14°C)** support Grieg's solid biological performance, reflected in a 92% survival rate and the highest post-smolt weight among peers (1.3 kg). While Mowi and SalMar operate at far larger scale and fully integrated value chains, Grieg's strong smolt strategy helps offset its smaller footprint, and its focus on a single, biologically favourable region provides a competitive advantage. Bakkafrost remains the biological leader (94% survival) but with lower post-smolt weights. Sales focus also differs: Mowi and Lerøy are globally diversified, whereas Grieg remains Europe-focused, benefiting more from increasing regional demand. (Appendix 3,4,10)

Biological Efficiency Driven by Technological Leadership

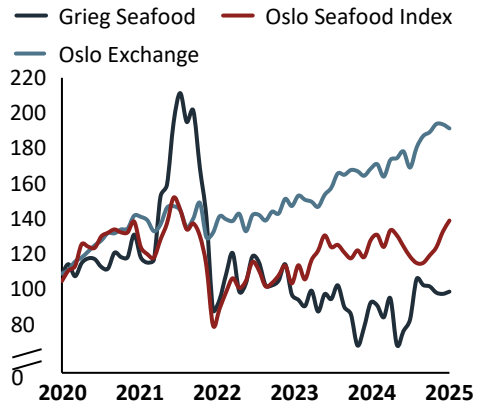

Norway's salmon industry is shaped by stringent biological standards, binding capacity limits, and significant cost exposure, creating a competitive environment where operational excellence and adaptability matter as much as scale. Rivalry remains elevated as producers compete within fixed production grids, while the sector's capital intensity and licensing scarcity keep the threat of new entrants low. Substitution pressure persists, though salmon's favourable health profile and low carbon footprint support resilient demand. Supplier power is heightened by concentrated global feed markets and volatile commodity prices, while buyer power increases through retail consolidation and long-term price benchmarking. Within this environment, **Grieg's advantage** stems not from scale but from **operating discipline** and **biological stability**. Its single-region model enables consistent execution, faster adoption of technology, and controlled cost development. High ASC coverage and efficient post-smolt practices strengthen compliance under Norway's regulatory framework, while the Oslo VAP facility supports gradual diversification away from pure HOG exposure. Combined, these capabilities position Grieg to navigate supply constraints, stabilize margins, and compete effectively despite structural disadvantages relative to fully integrated majors. (Figure 14, 15)

Figure 16: PESTEL *Source: Team Analysis*

Political Factors - *High*	Technological Factors - *Moderate*
Resource-rent tax, strict licensing and traffic-light biomass limits, municipal approval risk, EU access advantage vs. US tariffs, public support for innovation and electrification.	Expansion of RAS and post-smolt capacity, adoption of digital tools and AI feeding, development of alternative feed ingredients, increased automation in cleaning and handling.
Economic Factors - *Moderate*	**Environmental Factors - *High***
Price volatility from tight supply, feed as key cost driver, NOK FX exposure, high capex needs for licences and infrastructure, continued inflation in energy and logistics.	Sea-lice pressure, rising climate-driven risks like heat, low oxygen and algae blooms, strict containment expectations, biomass allowances tied to environmental indicators.
Social Factors - *Low*	**Legal Factors - *High***
Growing demand for sustainable seafood, NGO and media scrutiny on lice and escapes, dependence on local community acceptance, competition for specialised aquaculture talent.	Comprehensive licence audits, expanding ESG reporting (Taxonomy and CSRD), evolving rent-tax framework, strict labour and safety rules, ongoing competition-law scrutiny.

Figure 17: Grieg Seafood benchmarked, rebased to 100 NOK [11/2020 - 10/2025]

Source: Refinitiv as of 10/2025

Strengthening Competitive Resilience in a High-Pressure Salmon Market

Norway's salmon industry faces high competitive rivalry, driven by its oligopolistic structure, biological performance differences, and tight production limits under the traffic-light system, which shifts competition toward cost efficiency, value-added products, and ESG differentiation. The threat of new entrants is low because the sector requires large capital investments, strict biological and environmental compliance, and strong technological know-how, while licenses are scarce and expensive. Substitutes pose a moderate threat, as salmon competes with cheaper terrestrial proteins and some plant-based alternatives, although salmon's strong nutritional profile and relatively low carbon footprint help protect demand. Supplier bargaining power is moderate to high, since a few major producers dominate global feed supply and input costs-especially fishmeal, soy, and oil-are volatile, limiting farmers' flexibility. Buyer power is moderate, with consolidated European retailers pushing for competitive pricing, though certifications and value-added processing help producers differentiate and secure stronger margins. Grieg responds to these forces by focusing on biological efficiency, ASC certification, and post-smolt investments that reduce costs and strengthen competitive positioning under Norway's production-cap system. The company also expands VAP, digital monitoring, and sustainable feed sourcing, which helps differentiate its products, reduce buyer pressure, and mitigate supplier concentration risks. (Appendix 6, 8).

For further detail, see Appendix 12: ESG Scorecard

ESG performance remains financially material to Grieg, where environmental, biological, and regulatory factors directly influence revenue and production cost. The company integrates sustainability within its operational and financial planning, guided by a double materiality assessment in accordance with ESRS and the EU Taxonomy Regulation (EU) 2020/852. Reporting covers all controlled entities and value chain impacts, with disclosure alignment to GRI and the UN Global Compact. Grieg demonstrates a solid overall ESG performance with no evident red flags across its environmental, social, or governance areas. The company shows consistent compliance, transparent reporting, and responsible operations in key areas such as fish welfare, community engagement, workforce safety, and governance structure. At the same time, Grieg is clearly committed to continuous improvement, actively working to strengthen biological performance, reduce environmental impacts, enhance diversity and inclusion, and reinforce long-term sustainability throughout the organization. Due to the lack of data, most of the ESG analysis is based on the Annual Report of 2024.

Balancing Progress and Setbacks in Environmental Action

Environmental efficiency remains financially material to Grieg's margins, as biological issues such as sea lice and disease increase unit costs. To mitigate this, the company invests in closed-containment post-smolt systems and digital monitoring to improve fish welfare and feed conversion. Scope 1-2 emissions were 490,886 tCO_2e in 2024 (-12% YoY) with a 2025 target of 278,000 t. While core farming activities are not yet EU-taxonomy aligned, 67% of 2024 CapEx was taxonomy-eligible, mainly for low-emission vessels and post-smolt projects. Feed sourcing remains a priority: Grieg uses 100% deforestation-free certified soy, limiting land-use risk. ASC-certified sites covered 92% of 2024 harvests (88% in 2023), with full coverage targeted for 2025. These measures strengthen biological performance and reduce exposure to Norway's "traffic-light" biomass quota adjustments. In Rogaland, the company eliminated antibiotic use through vaccines and preventive fish-health programs. Sea-lice treatments were reduced significantly, with 57% of harvested fish groups requiring no delousing, supported by post-smolt strategies. The region advanced the Årdal Aqua post-smolt facility, which stocked its first smolt in autumn, enabling shorter sea cycles and lower environmental impact. Grieg's 2024 environmental performance shows progress but also challenges. While the plan targeted 4.2% annual GHG reductions from the 2020 baseline, emissions rose by 2-3% due to slow progress on the two most material decarbonization levers: sustainable feed (limited supplier data and upstream reductions) and low-emission transport (high cost and operational disruption). The company nevertheless launched fossil-fuel-reduction projects across regions with a combined potential of 2,668 tCO_2e, and continues shifting toward shorter transport routes and more value-added processing. The Gardermoen VAP project and the goal to reach 25% VAP by 2026 support reduced Scope 3 logistics emissions. Biodiversity impacts remain monitored in Rogaland. Figure 18 shows that while several locations recorded issues related to fish escapes or interactions with wild species, the majority of sites passed ecological-status assessments and only a few were in sensitive areas-indicating active monitoring and that overall ecological impact remains limited.

Building a Resilient Workforce

Grieg employs around 187 staff in Rogaland 2024, with operations centered in coastal Norwegian communities. Its health, safety, and labor policies maintain lost-time injury rates below the aquaculture industry average, supporting workforce stability and cost control. Supplier and community engagement programs reduce operational disruption risk and enhance license to operate. No material breaches of human rights or labor standards were reported in 2024. In 2024, Grieg Seafood continued to strengthen its social foundation, with a focus on employee retention, diversity, and fair remuneration. Across the Group, Grieg employed 826 people (593 men, 233 women) and recorded a low turnover rate of 0.2. The company has set clear diversity targets: the Board consists of 40% women (average age 54; 60% independent), while women represent 33% of Group Management (average age 51). The 2024 gender pay gap of -3% indicates that women earned slightly more than men in comparable roles, demonstrating progress on equitable remuneration. Efforts to attract and advance women-through fair recruitment, flexible work arrangements, and leadership development-contributed to a strong SHE Index score of 73, above the Norwegian company average.

Governance Integrity in a Family-Controlled Corporate Structure

Grieg Seafood formally follows the Nordic governance model, with a fully non-executive Board and a majority of independent directors supported by the Audit and Sustainability/SSG Committees. However, family ownership concentration remains the defining governance factor. Grieg Aqua AS-owned and controlled by Per Grieg Jr. and family-holds 50.2% of shares, giving the family effective control of the company (Figure 4). This influence extends across governance bodies: Per Grieg chairs the Board, the family is represented on the Nomination Committee (Chair: Elisabeth Grieg), and Per Grieg also chairs the Remuneration Committee. Leadership continuity is reinforced by long internal tenures among senior executives, including CEO Nina Willumsen Grieg (Appendix 5). While this supports sector expertise, it increases reliance on minority-shareholder protections, committee independence, and strict conflict-of-interest procedures. Safeguards exist-mandatory recusals, independent audit oversight, and established whistleblower and anti-corruption channels-but concentration risk remains material. The company has no anti-takeover mechanisms: any takeover bid must be decided by the General Meeting with a two-thirds majority of both votes cast and share capital represented, supporting equal treatment in change-of-control situations. Executive remuneration is linked to biological stability, ASC progress, sustainability indicators, and operational performance, though family involvement in remuneration governance requires ongoing monitoring. The Board's dividend policy targets 30-40% of profit after tax (capped at 50% by Green Bond terms), ensuring payout discipline. No material ethics, compliance, or governance breaches were reported in 2024. Overall, Grieg's governance structure is formally robust, but family control and family representation in key committees remain the central considerations for investors. Sustained transparency and strong independent oversight are essential to safeguarding minority-shareholder interests.

Successful Transformation Drives Operational Performance

Increasing CapEx is accelerating the company's post-smolt strategy and reinforcing its technology leadership, resulting in meaningful operational and financial improvements. As smolt size increases from 670g in 2024 to 1,290g in 2025 and a targeted 1,400g by 2027, time in sea is reduced from 389 days to roughly 276 days (-30%) and ultimately by 35-40%, enhancing biological performance and materially lowering risk exposure. With licensed biomass held constant at 17,800 tonnes, this reduction in the sea phase enables **MAB utilization to rise from 1.6x to 2.0x** by FC2030 without the need for new licenses, effectively doubling production potential while supporting a targeted 95% survival rate. These efficiencies translate directly into financial outcomes: EBITDA margins are projected to recover from 14.8% in PF2025 to 23.0% by FC2030, while revenues from Rogaland operations increase from NOK 2.4bn in 2024 to NOK 4.5bn by 2030 (CAGR 10.9%), supported by higher throughput, biological stability, and a growing share of value-added products. Importantly, this long-term transformation is also enabled by the company's shareholder structure, where majority family ownership allows for rapid strategic decision-making and the ability to execute transformational investments without the constraints of short-term market expectations. As stewards of a heritage business, the family has a strong vested interest in safeguarding operational continuity, sustaining biological excellence, and ensuring the company's long-term success across generations.

Biological Excellence Boost Strong Revenue Evolution

We project Grieg's revenues from its Rogaland operations to increase from NOK 2.4bn in 2024 to **NOK 4.5bn by 2030**, implying a CAGR of 10.9% (Figure 23). Growth is driven by biological efficiency gains, as described above and a growing share of value-added products, as well as by a conservative price increase, which reflects the inflation and demand factors. The new VAP facility at Oslo Airport (10-12kt capacity) will further enhance revenue quality by rebalancing the sales mix toward processed formats. Early excess capacity will be used for third-party processing for producers such as Mowi and SalMar, generating high-margin service revenue at an estimated 20% premium to whole-fish export prices. For Grieg's own volumes, we assume a 25% price premium (in line with industry peers) for VAP products, consistent with historical export data showing fillets trading 20-40% above whole salmon (NOK 149-164/kg vs. NOK 107/kg in 2024). This premium is conservative given that smoked or portioned formats often achieve 50-100% markups. As a result, **VAP's share** of total revenue is projected to gradually rise **from 5% in 2025 to 25% by 2030**, supported by strong ASC certification positioning in sustainability-focused European and Asian markets. These operational improvements are reinforced by favourable market fundamentals: global salmon demand is expected to grow 4-5% annually through 2030, while supply expansion remains constrained at 2-3% under Norway's traffic-light system. This continued imbalance sustains high prices, benefiting Grieg's expansion.

Cost Control and Technology Leadership allow Margin Expansion

We expect Grieg's farming cost per kilogram to decline in the near term as the company completes its operational transformation and captures technological efficiency gains. The key drivers are the rollout of larger post-smolt (targeting 1.4 kg by 2027), higher survival rates above 93 %, and shorter sea-phase cycles, which together reduce feed consumption, biological losses, and treatment costs. The consolidation of production in Rogaland eliminates regional inefficiencies, lowers logistics expenses (given its proximity to Norway's main air hub) and improves asset utilization. As these efficiencies materialize, we project farming **EBITDA margins to expand by roughly 7 ppt.** over 2025-2030. As these operational gains are realized and the production process reaches a steady state, cost reductions become incremental, and the long-term trajectory will reflect only general cost inflation in Norway. This pattern, an initial structural improvement followed by inflation-linked stability, is consistent with the industry's biological and technological maturity, where further efficiency gains are marginal once optimal production parameters are reached (Figure 25).

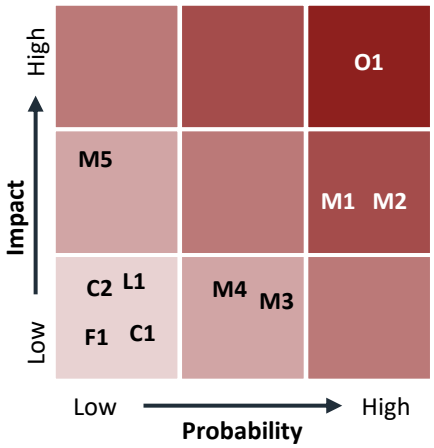

Deleveraging and Disciplined Dividends Drive Shareholder Value

Grieg's capital structure improves significantly through the transformation, with the **equity ratio rising from 41.5% in 2026 to over 60%** from 2028 onward, exceeding the **long-term >50% target** and above the 31% covenant threshold. Reduced biological volatility and stronger cash generation support a decline in financial debt from NOK 3.9bn in 2025 to NOK 950m by 2030, enabling deleveraging without limiting investment capacity. A gradual increase toward the **30-40% payout target** enhances shareholder value without compromising flexibility. (Figure 24)

Despite operating in a biologically and market-sensitive industry, Grieg Seafood has developed a robust risk-mitigation framework that meaningfully strengthens its resilience. The company combines strong biological performance in Rogaland with advanced farming practices, diversified global sales, active hedging strategies, and a disciplined regulatory and compliance approach. These measures, spanning operations, markets, finance, and governance, enable Grieg to manage volatility proactively and preserve stability across its value chain.

Figure 27: Risk Matrix

Source: Team Analysis

Rogaland Farming Concentration: Probability High - Impact High

After the divestment of Finnmark and Canada, all production is concentrated in Production Area 2 (PO2) in Rogaland. PO2 is one of Norway's 13 official salmon-farming regions, and its classification under the national traffic-light system determines whether producers may increase, maintain, or must reduce biomass. PO2 is currently yellow, which permits continued operation at current levels but restricts growth and increases sensitivity to environmental changes. This single-region footprint heightens exposure to localized biological and environmental volatility, as any adverse development in PO2 impacts the full harvest base simultaneously. Relevant risk drivers include elevated seawater temperatures, gill disease, sea-lice pressure, harmful algae or jellyfish events, oxygen fluctuations, escape incidents, and potential disease outbreaks. A deterioration in PO2's environmental indicators could also trigger stricter regulatory limits, directly affecting biomass utilization, farming cost, and earnings stability. Mitigation is supported by Rogaland's historically strong biological performance, high-quality smolt inputs, ASC-certified sites, and Grieg's post-smolt strategy, which shortens time at sea and improves resilience during challenging periods (Appendix 3,4,10). Advanced monitoring, fallowing regimes, and non-pharmaceutical lice tools further reduce exposure. These measures materially improve robustness but cannot eliminate the structural dependence on a single production area, making biology and regulation in PO2 central to New Grieg's risk profile.

Salmon and Feed Price Fluctuation: Probability High - Impact Medium

Salmon prices are volatile, influenced by global supply and demand dynamics. Since salmon is largely traded as a commodity, Grieg's earnings are highly sensitive to market price changes. To mitigate this risk, Grieg diversifies its sales across multiple markets (Europe, North America, and Asia) and uses financial and physical contracts to secure portions of its sales at fixed prices. The company also strengthens its brand portfolio and expands into VAP to reduce dependency on spot market prices. Feed represents the largest amount of total production costs, making Grieg highly exposed to fluctuations in feed ingredient prices such as fishmeal, soy, and oils. The company mitigates this risk by improving feed efficiency through higher post-smolt production, research into alternative and novel ingredients, and optimizing feed conversion ratios. These initiatives reduce feed use per kilogram of salmon produced and lower dependency on volatile raw material prices. As a global exporter, Grieg faces risks from tariffs, trade barriers, and regulatory changes in key markets such as the EU, UK, USA, and Asia. To mitigate these risks, Grieg actively monitors international trade developments and engages with authorities and industry associations to secure market access. The company's sales geographic diversification across multiple regions also helps reduce dependency on any single market. Grieg mitigates this risk by focusing on operational efficiency, biological performance, and sustainable growth. The company targets higher smolt sizes and productivity improvements to remain cost-competitive, while also emphasizing brand development and value-added products to differentiate from commodity-based competitors. Furthermore, the company is significantly exposed to national regulations, including licensing conditions, environmental requirements, and the resource rent tax (salmon tax). The company mitigates this risk by maintaining close dialogue with Norwegian authorities, ensuring strict compliance, and optimizing operations to meet regulatory demands. Changes in consumer behaviour toward alternative proteins or sustainability concerns could affect demand for farmed salmon. Grieg mitigates this risk by offering a diversified and sustainably certified product portfolio and investing in VAP to meet evolving consumer preferences. Its commitment to transparency, fish welfare, and climate-friendly production supports long-term consumer trust and market positioning.

Figure 28: Risks & Mitigation Rogaland

Source: Team Analysis

Key Risk	Mitigation
Operational Risks	
O1: Rogaland farming concentration	Focus on its most stable region, leveraging its post-smolt strategy
Market & Political Risks	
M1: Salmon price fluctuation	Maintaining high contract share of Rogaland harvest volumes (ca. 58%)
M2: Feed price fluctuation	Feed efficiency through post-smolt production, fixed contracts and own feed production
M3: Trade restrictions	Diversified market exposure
M4: Global increase in salmon supply	Increase share of VAP securing higher margins and reduce exposure to raw fish price pressure
M5: Shift of consumer preference	Diversified product portfolio (increasing VAP)
Compliance/ Legal Risks	
L1: Ongoing legal proceedings and investigations	Full cooperation and transparency with regulators
Financial/ Liquidity Risks	
F1: Capital intensive business	Maintaining strong quity ratio, factoring arrangements
Currency and Interest Rate Risks	
C1: Most of Grieg's income is in fx	Syndicated debt in EUR as natural hedge and additional fx hedging
C2: Floating-rate debt	Hedging 20-50% of ist loans with interest rate swaps

Compliance/ Legal Risks: Probability Medium - Impact Medium

Grieg Seafood faces a compliance and legal risk related to the European Commission's investigation and UK damages claims alleging anti-competitive behaviour in the salmon market. The company has carefully reviewed the allegations, responded to the Statement of Objections, and continues to fully cooperate with authorities. It is actively defending itself against what it considers unsubstantiated claims, supported by legal counsel. In parallel, Grieg maintains a strong compliance framework and competition law training to prevent future exposure and limit potential financial or reputational impact.

Other Risks: Probability Low - Impact Low

Grieg is exposed to financial market risks primarily through currency and interest rate fluctuations. A significant share of the firm's revenues is generated in foreign currencies (mainly EUR and USD), while its financial reporting is in NOK. This exposes the company to potential earnings volatility if exchange rates move unfavourably. To mitigate this, Grieg maintains a portion of its syndicated debt in EUR, providing a natural hedge against euro-denominated revenues. In addition, the sales organization actively uses financial hedging instruments when required to manage short-term foreign exchange exposure, and the firm benefits from a diversified currency mix across key markets, reducing dependency on any single currency. Grieg is also exposed to interest rate risk through its floating-rate syndicated loans and bond financing, which are linked to NIBOR. To reduce this exposure, the company follows a policy of hedging 20-50% of its interest-bearing debt through interest rate swaps. As of June 2025, 58% of gross debt is hedged, significantly limiting the impact of rising interest rates. The green hybrid bond, although classified as equity, is subject to rate adjustments but provides additional flexibility, as Grieg can defer interest payments if needed. Together, these measures strengthen financial stability and ensure predictable financing costs amid market volatility.

VALUATION

Implied Share Price (NOK)	80.84

Figure 32: Impact of CapEx and D&A on FCFF [NOK million]

Source: Team Analysis

Discounted Cash Flow Model (DCF)

The intrinsic valuation of Grieg's business was conducted using a DCF model to arrive at a 12-month target price of NOK 80.84, which represents a 19% upside over the current market price of NOK 67.90 (as of 31.10.2025). Due to the distinct characteristics of the seafood industry, traditional valuation methods for non-financial companies can be applied. As such, a DCF approach was employed to value Grieg. This methodology allowed us to determine the market value of equity for Grieg Seafood. Finally, this led to the determination of Grieg's target share price.

Revenue growth

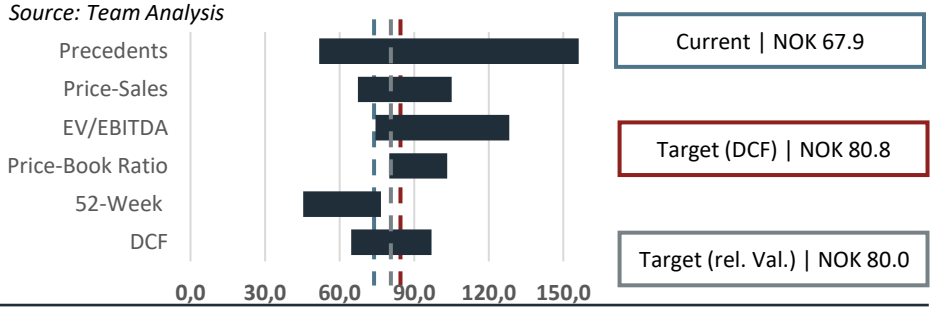

Our revenue forecast assumes an 11.02% CAGR from 2025–2030, driven by higher harvest volumes from improved biological performance and a gradual shift toward value-added products. Average realised prices reflect a 25% VAP premium and long-term salmon spot prices consistent with industry forecasts under constrained supply growth. VAP's share of revenue increases from 5% in 2025 to 25% by 2030, supporting a higher blended ASP and expanding EBITDA margins. These assumptions are directly linked to the operational improvements outlined in the Financial Analysis section and form the basis for our DCF projections.

WACC and Beta Computation

To determine the discount rate for our valuation of Grieg Seafood, we computed the WACC by estimating the cost of equity and cost of debt based on market data and Damodaran's methodology. The cost of equity was derived using the CAPM approach, applying a risk-free rate of 4.14% (10-year Norwegian government bond, as of 17.11.2025) and a market risk premium of 5.42%. The levered beta was estimated at 1.148 was obtained from a regression of Grieg Seafood's monthly excess returns on the Oslo Benchmark Total Return Index, using a 10-year estimation window, resulting in a cost of equity of 10.37%. The cost of debt was initially determined using Damodaran's synthetic credit rating methodology. Grieg's 2024 interest coverage ratio of –2.26 implies a D2/D synthetic rating, which corresponds to a default spread of 19%. Adding this spread to the risk-free rate yields a theoretical pre-tax cost of debt of 23.14%. This unusually high rate does not reflect the company's long-term funding profile but rather short-term distortions caused by restructuring, asset divestments and temporarily depressed earnings. Therefore, we apply the 23.14% cost of debt only in Year 1 of our DCF to capture the immediate risk associated with the transition phase. From 2026 onward, we assume the cost of debt normalizes as Grieg stabilizes as a focused, single-region operator. We therefore revert to the company's actual average cost of debt of 7.2%, as reported in the 2024 Annual Report, which is also broadly consistent with sector financing costs. Using this normalized cost of debt results in a steady-state WACC of 9.17% for the outer forecast years, while the transition-year WACC remains at 11.91%.

Figure 33: Football Field Summary

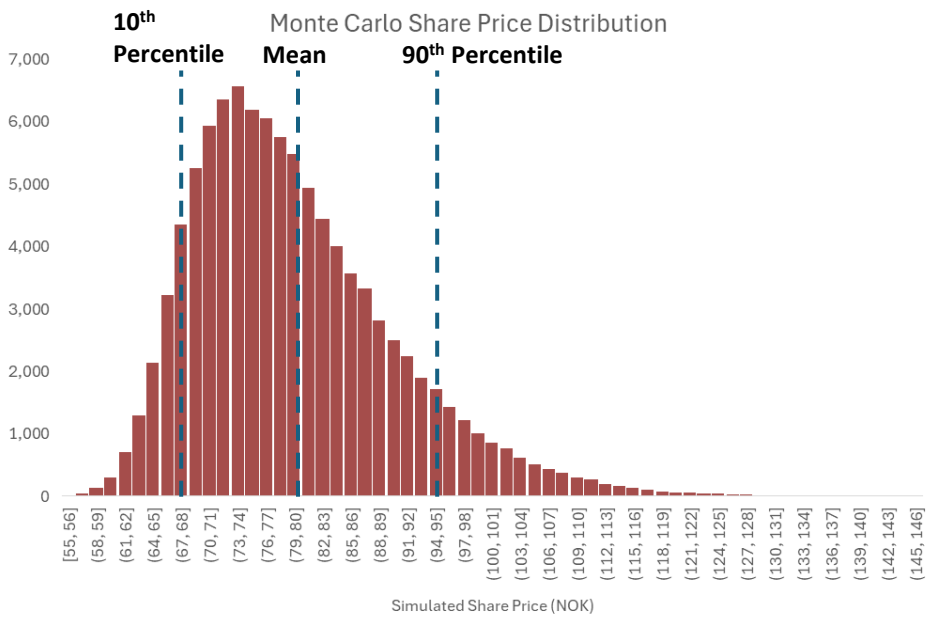

Source: Team Analysis

Sensitivity Analysis

To assess the robustness of our valuation, we complement the base-case DCF with a Monte Carlo simulation and a structured sensitivity matrix, presented in Figure 34 and Appendix 15. In the Monte Carlo framework, the key value drivers, FCFF development, forecast-horizon growth, terminal growth, beta, capital structure and the cost of debt, are varied within ranges that reflect plausible conditions for Grieg Seafood. Forecast-horizon growth can fall up to three percentage points below the base case, FCFF in the first two years varies within a ±25 million NOK band, beta and the debt-to-equity ratio may shift toward peer levels, terminal growth varies by ±0.5 percentage points, and the cost of debt ranges from 7.2 to 17.2 percent. Running 100,000 iterations produces a valuation distribution with a mean of NOK 79.42 and a standard deviation of NOK 10.78, bounded by NOK 54.67 and NOK 145.82, with a skewness of 0.95 and kurtosis of –1.84. The 10th, 75th and 90th percentiles lie at NOK 67.46, NOK 85.40 and NOK 94.10, indicating that upside scenarios occur more frequently than large downside cases. Appendix 15 provides a single-factor view by varying WACC from 8.17 to 10.17 percent and terminal growth from 20.16 to 27.16 percent, yielding valuations between roughly NOK 66.7 and NOK 106.7 per share. Around the base-case intersection of a 9.17 percent WACC and a 24.16 percent terminal growth rate, a 0.5-percentage-point increase in WACC lowers the valuation by about NOK 3-4, while a 0.5-percentage-point increase in terminal growth raises it by around NOK 1. Together, the two analyses show that the DCF behaves predictably across a wide but realistic range of assumptions and that the valuation remains stable without being driven by any single input.

Figure 34: Sensitivity Analysis – Monte Carlo Share Price Distribution

Descriptive Statistics:	
Mean	79.42
Variance	116.18
Standard Deviation	10.78
MIN	54.67
MAX	145.82
Skewness	0.95
Kurtosis	- 1.84

Percentiles:	
10th Percentile	67.46
25th Percentile	71.56
75th Percentile	85.40
90th Percentile	94.10

Relative Valuation

We base our relative valuation on the EV/EBITDA multiple, as it provides the most reliable indication of operating performance in the salmon farming industry. EV/EBITDA reflects the capital-intensive nature of aquaculture, where substantial investment in biomass, smolt capacity, and infrastructure drives value creation long before it is fully captured in accounting earnings. Furthermore, EV/EBITDA neutralizes the volatility created by biological fair-value adjustments, which can distort reported profit without reflecting changes in underlying cash generation. This makes the multiple particularly relevant for a company undergoing post-restructuring margin and efficiency improvements, as operational progress is reflected more quickly and more accurately than through earnings-based measures. The implied target share price of the relative valuation is NOK 80, representing an upside potential of approximately 18% relative to the current share price of NOK 67.9. Furthermore, this value is closely aligned with our DCF valuation of NOK 80.7, reinforcing the credibility of the upside priced into our investment case. The convergence of both methodologies indicates that the market continues to value GSF on the basis of historical volatility rather than its improved operating foundations. As restructuring and transformation benefits continue to materialize and visibility on earnings strengthens, we see meaningful scope for a valuation re-rating, capturing the operational upside and supporting our bullish stance.

The restructuring has reduced operational risk and increased earnings visibility by concentrating production in its strongest and most profitable region, where biological control and cost efficiency are highest. With a more focused footprint, improved KPIs, and expanding VAP exposure, GSF now exhibits characteristics closer to premium operators, providing a credible basis for the company to trade at higher EV/EBITDA multiples going forward.

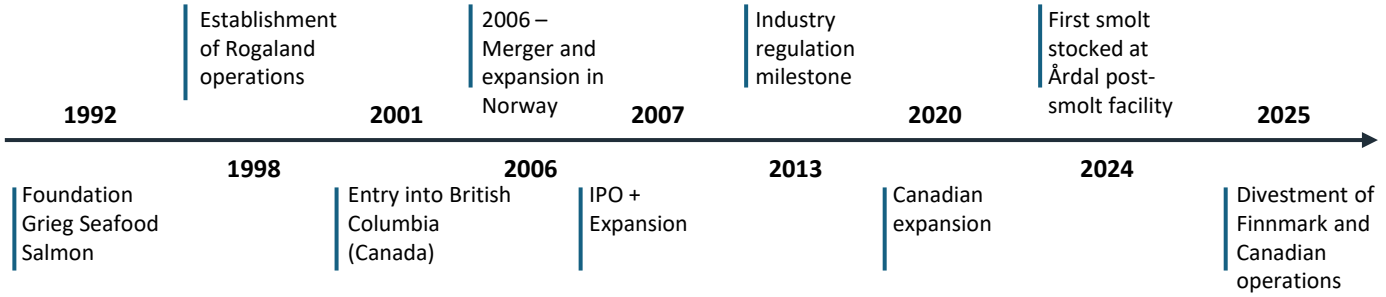

Figure 35: Historic Relative Valuation

Source: Team Analysis

EV/EBITDA	Grieg Seafood	Seafood Benchmark
2021	14.74	17.75
2022	5.14	10.37
2023	9.94	9.73
2024	22.41	13.45
Q2/ 2025	31.81	15.83

Appendix 5: Management Team Summary

Name	Bio Summary
 Nina Willumsen Grieg (CEO)	Nina has held senior strategic and operational roles at Grieg Seafood since 2015, including Regional Director for Rogaland (2021-2025) and Director of Business Development. She previously worked in strategy and operational consulting at PwC and Accenture and has experience as a board member.
 Magnus Johannesen (CFO)	Magnus is overseeing finance, M&A, taxation, ESG reporting, compliance, and internal controls. He has prior experience as a Chief Investment Officer and as a consultant at McKinsey specializing in finance and risk. He holds an MSc in Accounting and Auditing, a BSc in Business and Administration, and also studied sociology at UC Berkeley.
 Kathleen O. Mathisen (CHRO)	Kathleen has broad experience in business-focused HR, especially in the international offshore oil and gas industry. She has held senior roles, including Vice President of HR at Dof Subsea.
 Alexander Knudsen (COO, Norway)	Alexander has 24 years of experience in the salmon farming industry and served as Regional Director of Grieg Seafood Rogaland from 2008-2020, achieving strong operational and biological results.
 Grant Cumming (COO, Canada)	Grant, former Regional Director of Grieg Seafood Shetland (2016-2021), has 28 years of aquaculture experience, including roles as a seawater site manager, production manager, and lecturer in aquaculture.
 Piotr C. Wingaard (CCO)	Piotr previously served as Director of Business Development and Controlling at Grieg Seafood Sales, contributing to major projects like Oslo Salmon Processing. He has extensive sales and investment experience in the salmon industry, with earlier roles at Fish Pool ASA, Biomega Group, Atlantic Sapphire, and Momentum AS.

Source: Team Analysis, Annual Report, Investor Relations

Appendix 6: Porter's 5 Forces

Competitive Rivalry - *High*

- Norway's salmon **industry** is highly **concentrated (Oligopolistic)**, with the top five firms producing over 70% of output
- Profitability varies widely based on **biological efficiency**
- **Growth is constrained** by the **traffic-light licensing system**, shifting competition toward cost efficiency, VAP and ESG strength rather than volume - while salmon is largely standardized, firms **differentiate** through certifications, quality, and VAP

Threat of new Entrants - *Low*

- **Licensing Constraints**: Norway's traffic-light system limits and tightly regulates farming licenses, which can cost ~NOK 200 million per site
- **Capital Intensity**: Entry requires major investments in e.g. post-smolt facilities, feed systems and technology
- **Regulatory Complexity**: Strict environmental and animal-welfare rules require sophisticated biological management
- **Technological Know-How**: Operators need deep expertise in biology, feed, and disease control, incl. by extensive data and R&D
- **Brand and Trust**: Retailers favor established suppliers with certifications (e.g. ASC)

Threat of new Substitutes - *Moderate*

- Salmon competes with cheaper **terrestrial proteins** and some wild-caught seafood, but these alternatives face health, sustainability, or supply limitations
- **Plant-based** and **lab-grown substitutes** remain costly and small-scale, appealing mainly to environmentally conscious consumers
- **Salmon's strong nutritional profile**, especially its omega-3 content, and a low carbon footprint make it hard to replace

Supplier Bargaining Power - *Moderate to High*

- **Feed Concentration**: A few major players control the majority of the global feed market
- **Input Volatility**: Feed makes up most of the production costs and depends on volatile fishmeal, soy, and oil prices, with limited hedging options
- **Innovation Dependence**: Farmers rely on feed suppliers' R&D in alternative proteins for sustainability gains
- **Switching Costs**: Long-term contracts and specific feed formulations restrict farmers' ability to switch suppliers quickly

Buyer Bargaining Power - *Moderate*

- **Retail Consolidation**: Large European retailers exert strong buying power and favor fixed-price volume contracts
- **Certification Premiums**: certifications (e.g. ASC and GLOBALG.A.P.) support product differentiation and premium pricing, reducing buyer power
- **Private-Label Risk**: Retailers' growing private-label salmon lines increase price pressure on suppliers
- **Product Mix**: Value-added processing helps producers avoid spot-price volatility and strengthen pricing control

Source: Team Analysis, Annual Reports and Industry Reports

Appendix 7: PESTEL Analysis

Political Factors

Norway's aquaculture sector operates under a stringent regulatory framework. The 2023 resource rent tax raised the effective marginal corporate tax rate to about 47 percent, reducing net earnings but reinforcing public oversight of a profitable natural-resource industry. Capacity expansion is tightly controlled through the traffic-light licensing system, which adjusts allowable biomass every two years based on environmental indicators, stabilizing biological risk but limiting volume growth. Local municipalities and coastal communities heavily influence site approvals and license renewals, making strong regional relationships essential. Trade policy also shapes the industry: Norway enjoys duty-free access to the EU via the EEA Agreement, while U.S. exports face tariffs of roughly 15 percent, steering shipments toward Europe and Asia. At the same time, the government supports innovation and sustainability through grants from Innovation Norway and Enova, promoting electrification, energy efficiency, and

Economic Factors

Salmon prices remain near record highs and are expected to stay elevated through 2026 due to tight global supply and slow license growth. Feed, which represents a majority of the production costs, has become cheaper after a 30% drop from 2023 peaks, though energy and logistics costs remain elevated. The industry is heavily exposed to currency movements: revenues in EUR and USD combined with NOK-denominated costs mean a weak NOK boosts margins but raises imported feed and equipment costs. Salmon farming is highly capital-intensive, requiring substantial investment in licenses, equipment, and RAS/post-smolt facilities.

Social Factors

Global demand for healthy, sustainable, and traceable protein continues to grow, with certified salmon (ASC, GlobalG.A.P.) earning premiums in key markets. While aquaculture is broadly supported, concerns over sea-lice, escapes, and coastal ecology have increased public scrutiny from NGOs and media, pushing producers toward greater transparency and sustainability. Strong community relations-through employment, taxes, and local engagement-remain essential for maintaining a social license to operate and securing site approvals. The industry also competes for highly skilled workers in biology, engineering, and technology; although Norway's labor costs are high, strong safety standards and inclusive practices support retention and ensure a qualified workforce.

Technological Factors

Norwegian producers are investing heavily in technology to improve biological control and efficiency. Larger post-smolt and expanded RAS capacity shorten time in sea, though fully land-based production remains costly. Offshore and semi-closed systems offer potential capacity growth beyond fjord limits but require substantial capital and regulatory approval. Digitalization and AI-through smart feeding, biomass sensors, and predictive analytics-are improving feed efficiency and reducing mortality. Feed innovation continues with algae-, insect-, and fermentation-based ingredients, supporting both cost and sustainability goals. Increasing automation, including robotics and net-cleaning systems, further reduces labor needs and enhances worker safety.

Environmental Factors

Climate change is increasing biological volatility through warmer waters, low oxygen, and algal blooms. Sea-lice remain the industry's biggest biological risk, with non-medicinal treatments now used in most of the cases. Tighter containment rules seek to prevent escapes and protect wild salmon genetics. Farmed salmon also has a low carbon footprint compared to conventionel protein sources, supporting its role in sustainable diets. Under the traffic-light system, environmental performance directly determines license volumes, with poor outcomes leading to biomass cuts. As a result, strong environmental stewardship has become both a regulatory requirement and a competitive advantage, driving investment in technology and transparent reporting to

Legal Factors

Norwegian salmon farming operates under strict legal oversight. All farms require government-issued licenses that undergo regular renewal and environmental audits. EU rules such as the Taxonomy and CSRD, along with national laws, mandate detailed ESG reporting and third-party assurance. The European Commission's antitrust investigation into major producers poses short-term legal and reputational risks. The 2023 resource rent tax remains under refinement, with ongoing debate over deductions for ESG investments. Labor and safety standards are tightly enforced under the Working Environment Act. Overall, this legal framework strengthens accountability and sustainability but increases compliance costs, favoring well-capitalized and transparent operators

Appendix 11: Peer-Comparison

These companies were selected as Grieg's peers due to their similarities in business models, market focus, and exposure to industry trends. Their relevance lies in providing a basis for comparison across Grieg's dimensions, offering insights into these segments where Grieg Seafood operates or seeks to expand.

- Largest fully integrated salmon farmer, supplying 8.5 million meals daily and harvesting ~502,000 tonnes of salmon per year
- Operates farms across Norway, Chile, Canada, Scotland, Ireland, the Faroes, and Iceland, with feed plants in Norway and Scotland and 33 processing facilities, selling products in Europe, the Americas, and Asia

- Fully integrated seafood value chain, handling 350,000-400,000 tonnes of seafood annually through a global footprint
- Global processing & distribution network with operations in 14 countries, Lerøy runs major processing facilities, distribution hubs, and sales units that supply more than 80 markets, combining its own production with significant third-party volumes

- Vertically integrated salmon producer, operating across the full value chain with major operations in Norway, Iceland, and Scotland
- Strong farming and processing footprint with offshore leadership, runs major processing hubs, and is a pioneer

- Highly integrated salmon producer in the Faroe Islands and Scotland that controls the full value chain
- Focus on large, high-quality smolt and sustainable growth with significant investments in advanced hatcheries, RAS technology, vessels, and infrastructure support higher smolt weights, reduced biological risk, and long-term expansion toward ~165,000 tonnes annual harvest by 2028

Source: Team Analysis, Annual Reports

Appendix 12: ESG Scorecard

Environmental	Grieg	Mowi	SalMar	Leroy	Bakkafrost
Fish Welfare & Mortality	Strong welfare performance in Rogaland, low antibiotics, improved mortality control.	Industry-leading systems but large scale increases biological volatility.	Solid biological results and strong control across regions.	Good welfare initiatives but variable across sites.	Strong hatchery strategy supports stable welfare outcomes.
Grade	*9*	*8*	*9*	*7*	*8*
Climate Impact	Improving footprint transparency, feed and transport remain main drivers.	Mature climate strategy with advanced reporting.	Structured climate targets, progressing reductions.	SBTi targets and integrated climate governance.	Efficient operations but limited disclosure depth.
Grade	*7*	*8*	*8*	*7*	*6*
Sea Lice and Treatment Practices	Post-smolt strategy reduces sea-lice exposure and treatments significantly.	Broad toolbox, increasingly non-medicinal, still challenged by scale.	Stable lice levels with preventive focus.	Solid management but higher reliance on mechanical treatments.	Large-smolt approach reduces time at sea and lice pressure.

Environmental Grade	**8.0**	**7.7**	**8.3**	**6.7**	**7.0**
Social					
Workforce well-being and safety	Strong HSE system, frequent reporting, low injury rates in core region.	Robust global HSE structure, consistent performance.	Good safety performance, continuous improvement.	Strong safety culture across operations.	Solid safety practices but varying by site.
Grade	*9*	*8*	*8*	*8*	*8*
Community Engagement	High transparency and strong local engagement, plus Indigenous stakeholder focus.	Broad global community initiatives.	Good regional engagement in Norway.	Strong local presence and community partnerships.	Strong community integration in Faroe Islands.
Grade	*9*	*8*	*8*	*9*	*9*
Diversity & Development	Clear diversity initiatives and employee development focus.	Structured global training and development programs.	Solid competence-building programs.	Strong youth recruitment and talent development.	Moderate diversity initiatives; development improving.
Grade	*8*	*7*	*7*	*7*	*6*
Social Grade	**8.7**	**7.7**	**7.7**	**8.0**	**7.7**
Governance					
Ownership & Board Structure	Transparent governance and professional board, though ownership concentrated.	Highly independent board and strong governance systems.	Solid governance with broad shareholder base.	Strong structure but influenced by strategic owner.	Good governance principles, moderate independence.
Grade	*7*	*8*	*8*	*7*	*7*
Risk & Compliance	Mature risk frameworks, strong internal audit, transparent reporting.	Very strong global compliance and risk systems.	Well-developed systems, strong reporting.	Good compliance structure under CSRD.	Solid risk approach with growing ESG integration.
Grade	*9*	*9*	*8*	*8*	*8*
Shareholder Rights	Concentrated family ownership may disadvantage minority shareholders.	Strong shareholder framework and equal treatment.	Standard Norwegian protections, transparent practices.	Equal-treatment policies and clear AGM structure.	Clear shareholder framework under Faroese governance.
Grade	*8*	*8*	*8*	*7*	*7*
Governance Grade	**8.0**	**8.3**	**8.0**	**7.3**	**7.3**
Overall ESG Score	**8.2**	**7.9**	**8.0**	**7.3**	**7.3**
